

CHAPTER – II

IDEATION PHASE

1.2 – Purpose of the Project

The electric vehicles are becoming very popular. People are buying them really fast. This means we need to find a way to keep an eye on how the batteries doing how they are being charged and how far the cars can go. The problem is that all the information about electric vehicles is spread out all over the place and it is hard to understand.

This project is trying to make a tool that uses Tableau to look at how electric vehicles are being charged how the batteries are doing how much energy they are using and how far they can go. The tool will take all the information about vehicles and turn it into pictures and graphs that are easy to understand. This will help people see what is going on compare how different cars are doing see how well they are being charged and figure out how far they can go based on things like how big the battery's how long it takes to charge how far they have gone and what the weather is like.

The tool will give people information about what's happening right now and what happened in the past. It will use graphs, maps and other things to help people make decisions, about electric vehicles, where to put charging stations and how to take care of the batteries. By using Tableau to make the information look nice the system will help people understand how electric vehicles work and support the idea of using cars that're good for the environment.

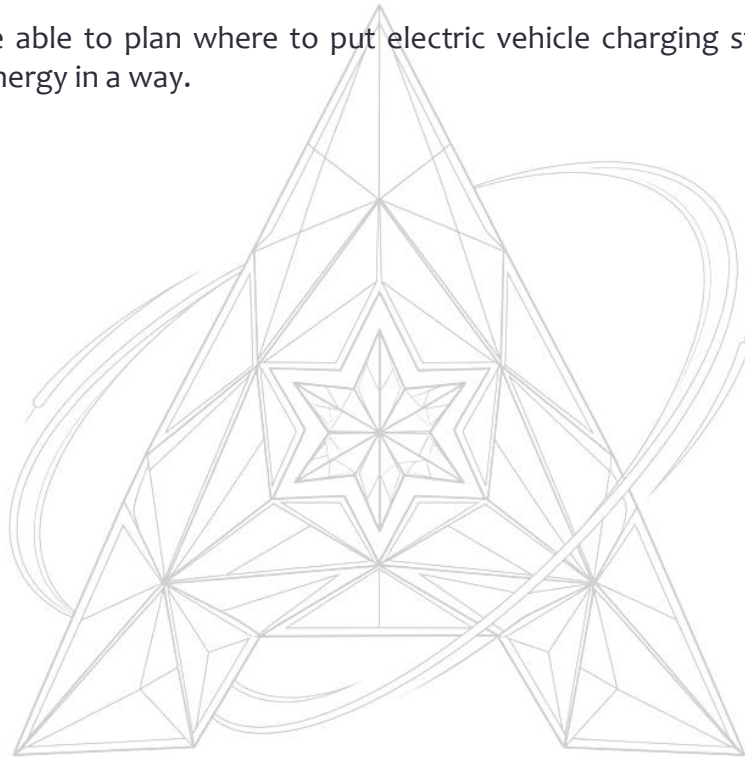

Objectives:

- Look at how much charge the electric vehicle batteries have and how far they can go.
- Make pictures of how it takes to charge the cars how much energy they use and which charging stations people use.
- Compare how different electric vehicle models are doing.
- Figure out what things affect how well the batteries work and how far the cars can go.
- Make pages that people can use to make decisions based on the information. ✨

Visualization Tool for Electric Vehicle Charge and Range Analysis using Tableau

Expected Outcomes:

- We will make Tableau pages that're easy to use.
- People will have an understanding of how electric vehicles are charged and how far they can go.
- We will be able to keep an eye on how the batteries are doing.
- We will be able to plan where to put electric vehicle charging stations and how to manage energy in a way.
