

## CHAPTER – X

### CONCLUSION

#### 10.1 – Conclusion

The Electric Vehicle Charge and Range Analysis Tool is really useful for people who want to see how electric vehicles are doing. This tool uses Tableau to show us how electric vehicles are performing. It takes a lot of information about electric vehicle charging, batteries, range and energy use. Puts it all together in a way that makes sense.

When we use this tool we can clean up the information make it look nice and then show it in a way that's easy to understand. This helps people see how much charge is left in the battery how far the vehicle can go and how energy it is using. The charts and graphs and maps are all interactive so people can play around with them. Get a better understanding of what is going on.

This tool is great for people who own vehicles and for people who study them or make them. It gives them the information they need to make decisions. The tool makes reports that're easy to look at and understand. We tested the tool to make sure it works right. It does. So this project shows us that Tableau is a powerful tool for helping us understand electric vehicle charging and range performance. The Electric Vehicle Charge and Range Analysis Tool is a help. Electric Vehicle Charge and Range Analysis is important, for people.
