

CHAPTER – XI

FUTURE SCOPE

11.1 - Future Scope

The tool for analyzing electric vehicle charging and range using Tableau can be made better with new technologies and features. This will make it more effective and easier to use. One idea for the future is to get data in time use predictive analytics and have systems that help make decisions about electric vehicles.

The tool can work with sensors in vehicles and charging stations that are connected to the internet. This way it can monitor battery health charging status and vehicle performance away. We can use machine learning and artificial intelligence to predict how batteries degrade estimate how far an electric vehicle can go and suggest the times to charge. Future versions might let users check electric vehicle performance on devices or the web. This means they can monitor their vehicles from anywhere.

The tool could also use weather and traffic data to make predictions about how far an electric vehicle can go. This is because weather and traffic can affect how energy the vehicle uses.

Some other ideas include:

1. Getting electric vehicle data in time using devices connected to the internet.
2. Predicting how far an electric vehicle can go using intelligence and machine learning.
3. Monitoring battery health and predicting when maintenance is needed.
4. Letting users access dashboards on devices and the web.
5. Using weather and traffic data.
6. Recommending charging times.
7. Analyzing data to plan charging stations.
8. Storing data in the cloud. Making reports.
9. Helping manage numbers of electric vehicles.
10. Making dashboards and automated reports.

These improvements will make the tool more useful, for people who own vehicles, researchers, manufacturers and policymakers. They will help make the electric vehicle ecosystem better.
